

## DESCRIPTION

### TRICYCLIC BENZOPYRAN COMPOUND AS ANTI-ARRHYTHMIC AGENTS

#### Technical Field

The present invention relates to benzopyran derivatives having the prolongation effect on the refractory period, which are used for the treatment of arrhythmia in mammals including human being.

#### Background Art

As benzopyran derivatives, 4-acylaminobenzopyran derivatives exemplified by Cromakalim have been known (for example, Japanese Patent Laid-open No. Sho 58-67683). These 4-acylaminobenzopyran derivatives exemplified by Cromakalim are known to open ATP sensitive  $K^+$  channel so as to be effective for the treatment of hypertension and asthma, but there has not been any mention as to the treatment of arrhythmia based on the prolongation effect on the refractory period.

In addition, it is reported that 4-aminobenzopyran derivatives that have  $\beta_3$ -receptor stimulating action are supposed to be effective for the treatment of corpulence (for example, WO 03/014113), but there has not been any mention as to the treatment of arrhythmia based on the prolongation effect on the refractory period in this document.

#### Disclosure of Invention

In the meanwhile, conventional anti-arrhythmic agents having the prolongation effect on the refractory period as a main mechanism (such as Class I drugs of anti-arrhythmic agent classification according to Vaughan Williams, or d-sotalol or dofetilide belonging to Class III) have the therapeutic problems in inducing highly dangerous arrhythmia leading to the sudden death from such as *torsades de pointes* among others due to prolongation of action potential in ventricular muscle correlated to the prolongation effect on the refractory period. Thus, treating agents with less adverse effect have been highly desired.

The inventors have investigated compounds having the prolongation effect on the refractory period selective for atrium muscle rather than for ventricular muscle in order to solve the problems, and consequently found that the compound of formula (I) or (II) has the prolongation effect on the refractory period selective for atrium muscle

without any influence on the refractory period and action potential in ventricular muscle. Thus, the present invention has been accomplished.

That is, the present invention relates to the following aspects:

HN-R

The compound according to the present invention has asymmetric carbon atoms at 3-position and 4-position, thus optical isomers thereof based on the asymmetric carbon atoms are present, and optical active substances can be also used in the application of the present invention, like racemic modifications. Further, cis- and trans-isomer based on configuration at 3-position and 4-position may be included, but trans-isomer is preferred.

Further, when the compounds can form their salts, the pharmaceutically acceptable salts thereof can also be used as active ingredients.

Examples of pharmaceutically acceptable salt are such as hydrochlorides, hydrobromides, sulfates, methanesulfonates, acetates, benzoates, tartrates, phosphates, lactates, maleates, fumarates, malates, gluconates, salicylates and the like.

Preferably, hydrochlorides, maleates and methanesulfonates may be mentioned.

The compound of formula (I-a) or (II-a) that is the compound of formula (I) or (II) wherein  $R^4$  is hydrogen atom and  $R^3$  is hydroxy group can be obtained by reacting the compound of formula (1) or (2) with the compound of formula (3) in an inert solvent as shown in the scheme below.

As the solvents used in the reaction of the compound of formula (1) or (2) with the compound of formula (3), the followings may be mentioned.

Sulfoxide type solvents exemplified by dimethylsulfoxide; amide type solvents exemplified by dimethylformamide and dimethylacetamide; ether type solvents exemplified by diethyl ether, dimethoxyethane, tetrahydrofuran and dioxane; halogen type solvents exemplified by dichloromethane, chloroform and dichloroethane; nitrile type solvents exemplified by acetonitrile and propionitrile; aromatic hydrocarbon type

solvents exemplified by benzene and toluene; hydrocarbon type solvents exemplified by hexane and heptane; ester type solvents exemplified by ethyl acetate; alcohol type solvents exemplified by methanol, ethanol, 1-propanol, 2-propanol and ethylene glycol; and water may be mentioned. Further, the reaction can be carried out in the absence of any solvent. Preferably, ether type solvents, nitrile type solvents and alcohol type solvents may be mentioned.

The reaction temperature is generally from  $-80^{\circ}\text{C}$  to the reflux temperature of the reaction solvent, preferably from  $-10^{\circ}\text{C}$  to  $100^{\circ}\text{C}$ .

The molar ratio of the reaction materials is within the range of 0.5-4.0, preferably 1.0-2.0, for compound (3)/compound (1) or (2).

Acid catalysts may be used in the reaction.

The acid catalysts used include inorganic acids exemplified by hydrochloric acid and sulfuric acid, Lewis acids exemplified by aluminum chloride, titanium tetrachloride, boron trifluoride diethylether complex, perchloric acid, lithium perchlorate, lithium bromide and ytterbium trifluoromethanesulfonate.

Preferable acid catalysts are lithium bromide and lithium perchlorate.

The synthesis of optically active compounds in the compounds of formula (I) or (II) is accomplished by use of a method for optical resolution of racemate (Japanese Patent Laid-open No. Hei 3-141286, US Patent No. 5097037 and EP Patent No. 409165).

In addition, the synthesis of the compound of formula (1) or (2) is accomplished by use of the following synthetic process:

- General synthetic process of benzopyran ring

The benzopyran ring can be synthesized according to known methods (methods described in J. M. Evans et al., J. Med. Chem. 1984, 27, 1127; J. Med. Chem. 1986, 29, 2194; J. T. North et al., J. Org. Chem. 1995, 60, 3397; as well as Japanese Patent Laid-open Nos. Sho 56-57785, Sho 56-57786, Sho 58-188880, Hei 2-141, Hei 10-87650 and Hei 11-209366 and the like.);

As described above, the inventors of the present invention found that the compound of formula (I) or (II) has a strong prolongation effect on the refractory period. The prolongation effect on the refractory period is one of mechanisms of anti-arrhythmic action and is an important indicator that can be taken in judging the effectiveness in clinical arrhythmia. Conventional anti-arrhythmic agents having the prolongation effect on the refractory period as the main mechanism (such as d-sotalol belonging to Class III of the antiarrhythmic agent classification according to Vaughan

Williams) have been the therapeutic problems in inducing highly dangerous arrhythmia leading to the sudden death from such as *torsades de pointes* among others due to prolongation of action potential in ventricular muscle correlated to the prolongation effect on the refractory period, and thus becoming the therapeutic problem in arrhythmia mainly of atrial muscle (such as supraventricular tachycardia, atrial flutter, atrial fibrillation and the like).

In order to solve the problems, the inventors of the present invention carried out the investigation of compounds having the prolongation effect on the refractory period selective for atrium muscle than for ventricular muscle, and found that the compound of formula (I) or (II) has a prolongation effect on the refractory period selective for atrium muscle without any influence on the refractory period and action potential in ventricular muscle. The difference between the findings by the inventors and the prior art is in providing the prolongation effect on the refractory period selective for atrium muscle to these compound group, which may be shown by the facts that there is no influence on the action potential duration period of isolated ventricular muscle and there is no influence on QT in the electrocardiogram of anesthetized animal. From above, the compounds of the present invention show no inducing action of arrhythmia in ventricular muscle, thus they can contribute to much safer use in arrhythmia mainly of atrial muscle in comparison with the prior art. The present technical knowledge is beneficial for therapeutic or preventive uses as anti-atrial fibrillation agents, anti-atrial flutter agents and anti-atrial tachycardia agents relating to paroxysmal, chronic, preoperative, intraoperative or postoperative atrial arrhythmia, prevention in the progression leading to embolus due to arrhythmia of atrial nature, prevention in the progression leading to ventricular arrhythmia or tachycardia from atrial arrhythmia or tachycardia, and averting the life threatening prognosis due to preventive action on atrial arrhythmia or tachycardia leading to ventricular arrhythmia or tachycardia.

Further, these compositions may contain the plurality of compounds according to the present invention.

To a solution of 7-chloro-2,2,9-trimethyl-2*H*-pyrano[2,3-*g*]quinoline (200 mg, 0.77 mmol) in ethyl acetate (3.0 mL), *N*-methyl imidazole (0.012 mL, 0.154 mmol) and ent-Ph,Ph salen manganese complex (8.0 mg, 0.0077 mmol) were added at room temperature and aqueous sodium hypochlorite solution (1.0 g, 1.513 mol/kg, 1.54 mmol) was added dropwise, and the resulting mixture was stirred for 40 minutes. Aqueous sodium hypochlorite solution (1.0 g, 1.513 mol/kg, 1.54 mmol) was added dropwise, and the resulting mixture was further stirred at room temperature for 30 minutes. Upon the completion of the reaction, aqueous sodium thiosulfate solution was added to the reaction solution, the resulting solution was filtered through celite and extracted. (2,2,9-Trimethyl-2*H*-pyrano[2,3-*g*]quinolin-7-yl)-acetate

To a solution of 2,2,9-trimethyl-2H-pyrano[2,3-g]quinoline described in Synthesis Example 1 (3.30 g, 14.6 mmol) in chloroform (33 mL), a solution of *m*-chloroperbenzoic acid (5.54 g, 19.5 mmol) in chloroform (13.2 mL)-methanol (3.3 mL) was added dropwise at room temperature, and the resulting mixture was stirred at room temperature for 1 hour. Upon the completion of the reaction, aqueous sodium thiosulfate solution was added thereto and the resulting solution was extracted therewith. The resulting organic phase was washed with aqueous sodium hydrogencarbonate solution and then with aqueous sodium chloride solution, and dried over anhydrous magnesium sulfate. After distilling off the solvent, acetic anhydride (46 mL) was added to the residue at room temperature, and the resulting mixture was stirred at 150°C for 1 hour. Upon the completion of the reaction, acetic anhydride was distilled off, the residue was neutralized with aqueous sodium carbonate solution, extracted with chloroform, and the resulting organic phase was washed with aqueous sodium chloride solution, and dried over anhydrous magnesium sulfate. After distilling off the solvent, the residue was purified by medium pressure column chromatography (hexane/ethyl acetate = 1/1) and the aimed product was obtained (yield: 23%).

A solution of ( $\pm$ )-*trans*-6-benzyl-3-hydroxy-2,2-dimethyl-4-[(2-phenylethyl)amino]-2,3,4,6-tetrahydro-pyrano[2,3-*f*]indol-7-one (173 mg, 0.39 mmol) in THF (2 mL) was added dropwise at -45°C, and the resulting mixture was stirred for 15 minutes. Upon the completion of the reaction, saturated aqueous ammonium chloride solution was added thereto, the resulting solution was extracted with ethyl acetate. The resulting organic phase was washed with water and then with saturated sodium chloride solution, dried over anhydrous magnesium sulfate, concentrated and purified by silica gel column (ethyl acetate) to obtain the aimed product (yield: 19%).

## Effects on the effective refractory period

## Method

Beagles were anesthetized with pentobarbital sodium and thoracotomy was done along the median line under a respirator and the incision was made on the pericardium to expose the heart. An electrocardiogram (ECG) was recorded using bipolar electrodes attached to the surface of the right atrial free wall, right atrial auricle, and right ventricular free wall. The vagal nerves were stimulated using an electrostimulation device with Nichrome wires inserted into the vagal nerves in the neck bilaterally. The conditions for electrostimulation to the vagal nerves were set such that the RR intervals on ECG were prolonged by about 100msec compared with those before the stimulation was started.

Atrial and ventricular effective refractory periods were determined by S1-S2 extrastimulus technique at basic cycle length of 300 msec during bilateral vagal nerve stimulation, using programmable electric stimulator. A train of 10 basic stimuli(S1) was followed by a premature extrastimulus (S2) at 2 times diastolic threshold. The S1-S2 interval was successively decreased by 2 msec, and the effective refractory period was defined as the point at which S2 failed to produced a propagated response.

For evaluation of drug effects, the atrial and ventricular effective refractory periods were determined before drug administration, then respective compound was administrated intravenously at the dose of 0.3 mg/kg or 0.6 mg/kg, and the atrial and ventricular effective refractory periods were determined from 5 minutes after the administration.

The results were shown as the prolongation time on the atrial and ventricular effective refractory periods, i.e. [effective refractory period after drug administration] - [effective refractory period before drug administration] (msec).

## Results

The compounds of the present invention exhibited the prolongation effect on the effective refractory period selective for atrium as shown in Table below.
